**IANA Registry for 6lowpan ESC Dispatch Code points  
draft-ietf-6lo-dispatch-iana-registry-01**

**Abstract**

[RFC4944](#) defines ESC dispatch type for additional dispatch bytes in the 6lowpan header. The value of ESC byte has been updated by [RFC6282](#). However, the usage of ESC extension byte has not been defined in [RFC6282](#) and [RFC4944](#). The purpose of this document is to define the ESC extension byte code points and to request corresponding IANA actions.

**Status of this Memo**

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on August 28, 2016.

## 1. Introduction

[RFC4944] [section 5.1](#) defines the dispatch header and types. The ESC type is defined for using additional dispatch bytes in the 6lowpan header. [RFC 6282](#) modifies the value of the ESC dispatch type and it is recorded in IANA registry [[6LOWPAN-IANA](#)]. However, the bytes and usage following the ESC byte are not defined in either [[RFC4944](#)] and [[RFC6282](#)]. However, in recent years with 6lowpan deployments, the implementations and Standards organizations have started using the ESC extension bytes and a co-ordination between the respective organizations and IETF/IANA are needed.

The following sections record the ITU-T specification for ESC dispatch byte code points as an existing known usage and propose the definition of ESC extension bytes for future applications. The document also requests IANA actions for the first extension byte following the ESC byte.

## 2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

## 3. Usage of ESC dispatch bytes

[RFC 4944](#) [[RFC4944](#)] first introduces this "ESC" dispatch header type for extension of dispatch bytes. [RFC 6282](#) [[RFC6282](#)] subsequently modified its value to [01 000000].

This document specifies that the first octet following the ESC byte be used for extension type (extended dispatch values). Subsequent octets are left unstructured for the specific use of the extension type:

```

0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|0 1| ESC          | ESC EXT Type  | Extended Dispatch Payload
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+

```

Figure 1: Frame Format with ESC Byte

ESC: The left-most byte is the ESC dispatch type containing '01000000'

ESC Extension Type (EET): It is the first byte following the ESC byte. Extension type defines the payload for the additional dispatch bytes. The values are from 0 to 255. Value 0 and 255 are reserved for future use. These values are assigned by IANA. The EET values are similar to dispatch values in the 6lowpan header except they are preceded by the ESC byte. Thus, ESC extension types and dispatch values are using orthogonal code spaces. Though not desirable, multiple ESC bytes MAY appear in a 6lowpan header. For example, it is possible to form [Mesh-hdr][6lowpan-IPHC][Payload][ESC][EET][Payload][ESC][EET][Payload] as long as it follows the same semantics defined in this document and does not induce fragmentation. [Section 3.1](#) describes how to handle unknown ESC dispatch type.

Extended Dispatch Payload(EDP): This part of frame format must be defined by the corresponding extension type. A specification is required to define each usage of extension type and its corresponding Extension Payload. For the sake of interoperability, specifications of extension bytes MUST NOT redefine the existing ESC Extension Type codes.

[Section 5.1 in RFC4944](#) indicates that the Extension Type field may contain additional dispatch values larger than 63, as corrected by [\[4944-ERRATA\]](#). For the sake of interoperability, the new dispatch type (EET) MUST NOT modify the behavior of existing dispatch types [\[RFC4944\]](#).

### **3.1. Interaction with other [RFC4944](#) implementations**

It is expected that [RFC4944](#) existing implementations are not capable of processing ESC extension data bytes as defined in this document. However, implementors have to assume that existing implementation that attempt to process an EET unknown to them will simply drop the packet or ignore the ESC dispatch bytes.

If an implementation following this document, during processing of the received packet reaches the ESC byte for which it does not understand the extension bytes (EET), it MUST drop that packet. However, it is important to clarify that a router node SHOULD forward a 6lowpan packet with the EET bytes as long as it does not attempt to process any unknown ESC extension bytes.

Sequence Of dispatch bytes and ESC bytes: Multiple ESC extension bytes may appear in a packet. The ESC bytes can appear as the first, last or middle dispatch bytes. However, a packet will get dropped by any node that does not understand the EET at the beginning of the packet. The closer to the end of the packet are the EET's, the higher chance there is that a legacy node will recognize and

successfully process some dispatch type [[RFC4944](#)] before the EET and then ignore the EET instead of dropping the entire packet.

### 3.2. ESC Extension Bytes Typical Sequence

The following diagram provides an example when ESC extension bytes might be used:

A LoWPAN encapsulated HC1 compressed packet:

```
+-----+-----+-----+-----+-----+-----+
| Dispatch | LOWPAN_IPHC hdr | Payld   | ESC   | EET | EPayld |
+-----+-----+-----+-----+-----+-----+
```

A LoWPAN\_IPHC Header, Mesh header and an ESC extension byte:

```
+-----+-----+-----+-----+-----+-----+
| M Typ | M Hdr | LOWPAN_IPHC Hdr | Payld | ESC   | EET | EPayld |
+-----+-----+-----+-----+-----+-----+
```

Figure 2: A 6lowpan packet with ESC Bytes

### 3.3. Example: ITU-T G.9903 ESC type usage

[G3-PLC] provides native mesh-under functionalities. The ESC dispatch type is used with the command frames specified in figure 9-12 and Table 9-35 in [[G3-PLC](#)]. The command ID values are 0x01 to 0x1F.

The frame format is defined as follows:

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| 0 1 | ESC           | Command ID   | Command Payload
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
```

Figure 3: G.9903 Frame Format with ESC Byte

### 3.4. NALP and ESC bytes

According to [RFC4944](#) [[RFC4944](#)] [section 5.1](#), NALP dispatch bytes are used for non-6lowpan packets. Since ESC bytes are part of 6lowpan dispatch types (extended), they are orthogonal to NALP bytes.

## 4. IANA Considerations

This document requests IANA to register the 'ESC Extension Type' values as per the policy 'Specification Required' [[RFC5226](#)] as specified in this document which follows the same policy as in the IANA section of [[RFC4944](#)]. For each Extension Type (except the Reserved values) the specification MUST define corresponding Extended Dispatch Payload frame bytes for the receiver implementation to read the ESC bytes with interoperability.

The initial values for the 'ESC Extension Type' fields are:

Value	Description	Reference
0	Reserved for future use	This document
1-31	Used by ITU-T G.9903 and G.9905 Command IDs	ITU-T G.9903 & ITU-T G.9905
32-254	Unassigned (Reserved for future IANA Assignment-- Spec Required)	This document
255	Reserved for future use	This document

Figure 4: Initial Values for IANA Registry

## 5. Security Considerations

There is no additional security threats due to the assignments of ESC byte usage described in this document. However, this document forbids defining any extended dispatch values or extension types that modifies the behavior of existing Dispatch types.

## 6. Acknowledgements

The authors would like to thank the members of the 6lo WG members for the comments in the mailing list. Many thanks to Carsten Bormann, Ralph Droms, Thierry Lys, Cedric Lavenu, Pascal Thubert for their discussions regarding resolving the bits allocation issues which led to this document. Jonathan Hui and Robert Cregie provided extensive reviews and guidance for interoperability. The authors acknowledges the comments from the following people for shaping this document: Paul Duffy, Don Sturek, Michael Richardson, Xavier Vilajosana and Scott Mansfield.
