

Applicability Statement for IETF Core Email Protocols
draft-klensin-email-core-as-00

Abstract

Electronic mail is one of the oldest Internet applications that is still in very active use. While the basic protocols and formats for mail transport and message formats have evolved slowly over the years, events and thinking in more recent years have supplemented those core protocols with additional features and suggestions for their use. This Applicability Statement describes the relationship among many of those protocols and provides guidance and makes recommendations for the use of features of the core protocols.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on October 1, 2020.

[1.](#) Introduction

In its current form, this draft is a placeholder and beginning of an outline for the Applicability Statement that has been discussed as a complement for proposed revisions of the base protocol specifications for SMTP [[RFC5321](#)] (being revised as ID.RFC5321bis [[ID.RFC5321bis](#)]) and Internet Message Format [[RFC5322](#)] (being revised as ID.RFC5322bis [[ID.RFC5322bis](#)]). Among other things, it is expected to capture topics that a potential WG concludes are important but that should not become part of those core documents.

As discussed in [RFC 2026](#) [[RFC2026](#)],

"An Applicability Statement specifies how, and under what circumstances, one or more TSs may be applied to support a particular Internet capability."

That form of a standards track document is appropriate because one of the roles of such a document is to explain the relationship among technical specification, describe how they are used together, and make statements about what is "required, recommended, or elective".

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)] and [RFC 8174](#) [[RFC8174](#)].

2. Applicability of Some SMTP Provisions

Over the years since [RFC 5321](#) was published in October 2008, usage of SMTP has evolved, machines and network speeds have increased, and the frequency with which SMTP senders and receivers have to be prepared to deal with systems that are disconnected from the Internet for long periods or that require many hops to reach has decreased. During the same period, the IETF has become much more sensitive to privacy and security issues and the need to be more resistant or robust against spam and other attacks. In addition SMTP (and Message Format) extensions have been introduced that are expected to evolve the Internet's mail system to better accommodate environments in which Basic Latin Script is not the norm.

This section describes adjustments that may be appropriate for SMTP under various circumstances and discusses the applicability of other protocols that represent newer work or that are intended to deal with relatively newer issues.

[[CREF1: ... Actual content to be supplied after WG consideration.]]

3. Applicability of Message Format Provisions

Placeholder:

I am not sure what, if anything, goes here. If nothing does, we drop the section.

[[CREF2: ... Actual content to be supplied after WG consideration.]]

4. MIME and Its Implications

When the work leading to the original version of the MIME specification was completed in 1992 [[RFC1341](#)], the intention was that it be kept separate from the specification for basic mail headers in [RFC 822](#) [[RFC0822](#)]. That plan was carried forward into [RFC 822](#)'s successors, [RFC 2822](#) [[RFC2822](#)] and [RFC 5322](#) [[RFC5322](#)]. The decision to do so was different from the one made for SMTP, for which the core specification was changed to allow for the extension mechanism [[RFC1425](#)] which was then incorporated into [RFC 5321](#) and its predecessor [[RFC2821](#)].

Various uses of MIME have become nearly ubiquitous in contemporary email while others may have fallen into disuse or been repurposed from the intent of their original design.

It may be appropriate to make some clear statements about the applicability of MIME and its features.

5. Other Stuff

It is fairly clear that there will be things that do not fit into the sections outlined above. As one example, if the IETF wants to say something specific about signatures over headers or what (non-trace) headers may reasonably be altered in transit, that may be more appropriate to other sections than to any of the three suggested above.

6. Acknowledgments

... To be supplied...

[[CREF3: But don't forget to mention the discussions on the SMTP list of the reasons for this document in the last half of 2019.]]

7. IANA Considerations

This memo includes no requests to or actions for IANA. The IANA registries associated with the protocol specifications it references are specified in their respective documents.

8. Security Considerations

All drafts are required to have a security considerations section and this one eventually will.

... To be supplied ...
